

SA MEDLASERS

Hair removal is always people's huge demand for both male and female.

Technologies for permanent hair removal have improved vastly over the years. Intense Pulsed Light (IPL) device is one of the best solutions when new high-tech innovations like the laser method, which sends a specific wavelength beam of light to damage hair follicles, has become increasingly popular.

Therefore, having the most cutting-edge technology, and always being on the forefront of lasers and other devices is so important in the hair removal industry.

With SA MEDLASERS, you can choose either Laser (SAMedRAZOR) or IPL (SAMed PULSE-SHR / 100 / 200) to have your treatment done easily and safely with perfect results.

Tattoo Removal - Think before you ink. It's an adage designed to prevent people from getting tattoos they may later come to regret, but with 34 per cent of tattooed Australians admitting they wish they hadn't been permanently stamped, and one in seven of that group considering removal.

The Q-Switched Nd:YAG (SAMed-QLASER) releases light energy at the rate of nanoseconds and selectively targets ink molecules within the tattoo, breaking the molecules into smaller particles. These particles can then be cleared by your body's natural immune system.

You will see both instant fading at the time of treatment as well as gradual fading in the weeks following your treatment.

Skin Rejuvenation Starting around age 25, our skin's natural regenerative process begins to slow down. The properties that keep it firm and supple begin to deplete, along with the skin's ability to hold on to moisture.

Hormonal changes later in life contribute to these negative changes; loss of collagen, elastin and subcutaneous fat lead to a dryer and looser appearance. Add in the reduction of blood vessels, and the skin gradually loses its youthful colour and glow.

The following options help to manage your clients' beauty.

During IPL skin rejuvenation (SAMedpulse-SHR, SAMedpulse-100/200), small pulses of light are applied to the skin—it's then transformed into heat. This heat stimulates the creation of new elastin and collagen coils, restoring the elastic networks under the skin. The effect is increased elasticity and luminosity, as well as a light filling out of the skin. The result is a younger, more brilliant skin that is noticeable from the first treatment!

Pigmentation means colouring.

Skin pigmentation disorders affect the colour of your skin. Your skin gets its colour from a pigment called melanin. Special cells in the skin make melanin. When these cells become damaged or unhealthy, it affects melanin production.

Some pigmentation disorders affect just patches of skin. Others affect your entire body.

Our latest Q-Switched Technology SAMed-QLASER can offer you the very best solutions for most of the pigmentation problems including freckles, age pigment, sun spots, pregnancy spots, Café-au-lait spots and even birthmarks.

Skin Tightening. Non-invasive skin tightening procedures are non-surgical devices used to stimulate collagen production in the deeper layers of the skin. Overtime, these devices work to shrink tissue, which has lost its tone and elasticity. Most of non-invasive skin tightening devices use laser energy (SAMed-QLASER), radiofrequency energy (SAMedShape, UltraBox), ultrasound energy (UltraBox), or a combination of these energies to deliver heat to the skin tissue.

These devices can be used on multiple areas of the body, such as the face, neck, abdomen, buttock, arms, and thighs. The number of treatments needed varies from device, energy source, location, and individual patient needs.

Vascular Treatments

Quantum RF AntiAge Machine. Microneedle RF 3-1

FACE

*Non-surgical face lifting *Skin tightening *Skin rejuvenation *Pore reduction *Scars & acne scars

BODY

*Scars *Stretch marks *Hyperhidrosis *Spider veins (vein cure option)

Machine contains: 1. *Cooling probe* 2. *Acne removal pen* 3. *Microneedle RF probe*
